1 Basics of Electromagnetism - A Quick Recap of The Static Theories

1.1 The Electric Field

1.1.1 Divergence and Curl of the Electric Field

1.1.2 Boundary Conditions

1.1.3 Conductors and Capacitors

1.2 Potentials

1.2.1 Laplace's Equation

1.2.2 Uniqueness Theorem

1.2.3 Multipole Expansion and Dipoles

1.3 Electric Fields in Matter

1.3.1 Forces and Torque

1.3.2 Linear Dielectrics and the Displacement Field

1.4 The Magnetic Field

1.4.1 Divergence and Curl of the Magnetic Field

1.4.2 Boundary Conditions

1.4.3 The Magnetic Vector Potential

Magnetic Dipoles

1.5 Magnetic Fields in Matter

1.5.1 Forces and Torque

1.5.2 Paramagnetism vs. Diamagnetism

1.5.3 Linear Media and the Auxiliary Field

1.6 Electrodynamics

1.6.1 Ohm's Law

1.6.2 The Electromotive Force

1.6.3 Faraday's Law

1.6.4 Overview and What's Next

2 Electromagnetism 2

2.1 Conservation theorems

Poynting's vector

$$\begin{aligned}\frac{dW}{dt} &= \int_V d\tau \mathbf{E} \cdot \mathbf{J} = \int_V d\tau \mathbf{E} \cdot \left(\frac{1}{\mu_0} \nabla \times \mathbf{B} - \epsilon_0 \frac{\partial \mathbf{E}}{\partial t} \right) \\ &= \int_V d\tau \left(\frac{1}{\mu_0} E_i \epsilon_{ijk} \partial_j B_k - \frac{\epsilon_0}{2} \frac{\partial E^2}{\partial t} \right) \\ &= \int_V d\tau \left(\frac{1}{\mu_0} E_i \epsilon_{jki} \partial_j B_k - \frac{\epsilon_0}{2} \frac{\partial E^2}{\partial t} \right) \\ &= \int_V d\tau \left(\frac{1}{\mu_0} \epsilon_{jki} \partial_j B_k E_i - \frac{1}{\mu_0} \epsilon_{jki} B_k \partial_j E_i - \frac{1}{\mu_0} - \frac{\epsilon_0}{2} \frac{\partial E^2}{\partial t} \right) \\ &= \int_V d\tau \left(\frac{1}{\mu_0} \nabla \cdot (\mathbf{B} \times \mathbf{E}) + \frac{1}{\mu_0} \mathbf{B} \cdot (\nabla \times \mathbf{E}) - \frac{\epsilon_0}{2} \frac{\partial E^2}{\partial t} \right) \\ &= \int_V d\tau \left(\frac{1}{\mu_0} \nabla \cdot (\mathbf{B} \times \mathbf{E}) - \frac{1}{2\mu_0} \frac{\partial B^2}{\partial t} - \frac{\epsilon_0}{2} \frac{\partial E^2}{\partial t} \right) \\ &= -\frac{d}{dt} \int_V d\tau \left(\frac{1}{2\mu_0} B^2 + \frac{\epsilon_0}{2} E^2 \right) - \frac{1}{\mu_0} \oint_S (\mathbf{E} \times \mathbf{B}) \cdot d\mathbf{a}\end{aligned}$$

The integrand in the first term is the total electromagnetic field energy per unit volume

$$u \equiv \frac{1}{2\mu_0} B^2 + \frac{\epsilon_0}{2} E^2$$

and the second term is called **Poynting's vector**

$$\mathbf{S} \equiv \frac{1}{\mu_0} (\mathbf{E} \times \mathbf{B})$$

If there are no charges in the volume we are considering, then there is nothing to do work on, and hence $dW/dt = 0$. Then

$$\frac{d}{dt} \int_V d\tau \left(\frac{1}{2\mu_0} B^2 + \frac{\epsilon_0}{2} E^2 \right) = - \int_V d\tau (\nabla \cdot \mathbf{S}) \Rightarrow \frac{\partial u}{\partial t} + \nabla \cdot \mathbf{S} = 0$$

Thus the **continuity equation for energy in the fields** reads

$$\frac{\partial u}{\partial t} + \nabla \cdot \mathbf{S} = 0$$

which clearly shows that \mathbf{S} can be interpreted as energy flux of the fields through a given surface. The fact that it also is this way for non-closed surfaces is directly seen from the differential version of the continuity equation above, and it is thanks to the divergence theorem that we get the local differential version independent of surfaces.

3 Exercises

3.1 Week 3

Problem 8.9 We have an infinite parallel plate capacitor with $\pm\sigma$ on plates at $z = \pm\frac{d}{2}$.

a) Determine all nine components of Maxwell's Stress Tensor in the region between the plates.

$$T_{ij} \equiv \epsilon_0 \left(E_i E_j - \frac{1}{2} \delta_{ij} E^2 \right) + \frac{1}{\mu_0} (B_i B_j - \delta_{ij} B^2)$$

Along the diagonal, $i = j$ such that

$$T_{xx} = \frac{\epsilon_0}{2} (E_x^2 - E_y^2 - E_z^2) + \frac{1}{2\mu_0} (B_x^2 - B_y^2 - B_z^2)$$

etc., while for the off-diagonal elements $i \neq j$ such that

$$T_{xy} = \epsilon_0 (E_x E_y) + \frac{1}{\mu_0} (B_x B_y)$$

etc.
